

Modul:Convert/data/sandbox

This page defines the conversion data used by [Module:Convert](#). All documentation (from [Module:Convert/doc](#)) is at that page.

Do not manually add units to this page. First add the unit definitions in [Module:Convert/documentation/conversion data](#). And then update this page by copying the results from [Module:Convert/makeunits](#) (those results appear at [Module talk:Convert/makeunits](#)).

Any changes should first be tested at [Module:Convert/data/sandbox](#)—see [Module:Convert/sandbox/testcases](#).

New units can be manually added at [Module:Convert/extra](#) as a temporary measure before being incorporated into this main table.

```
-- Conversion data used by [[Module:Convert]] which uses mw.loadData() for
-- read-only access to this module so that it is loaded only once per page.
-- See [[:en:Template:Convert/Transwiki guide]] if copying to another wiki.
--
-- These data tables follow:
--   all_units           all properties for a unit, including default output
--   default_exceptions exceptions for default output ('kg' and 'g' have differ
--   link_exceptions     exceptions for links ('kg' and 'g' have different links)
--
-- These tables are generated by a script which reads the wikitext of a page that
-- documents the required properties of each unit; see [[:en:Module:Convert/doc]]

-----
-- Do not change the data in this table because it is created by running --
-- a script that reads the wikitext from a wiki page (see note above).  --
-----
