local function input_from_property(tdata, parms, pid)
	-- Given that pid is a Wikidata property identifier like 'P123',
	-- return a collection of {amount, ucode} pairs (two strings)
	-- for each matching item/property, or return nothing.
	-----------------------------------------------------------------------
	-- There appear to be few restrictions on how Wikidata is organized so it
	-- very likely that any decision a module makes about how to handle data
	-- will be wrong for some cases at some time. This meets current requirem
	-- For each qualifier (or if no qualifier), if there are any preferred
	-- statements, use them and ignore any normal statements.
	-- For each qualifier, for the preferred statements if any, or for
	-- the normal statements (but not both):
	-- * Accept each statement if it has no qualifier (this will not occur
	--   if qual=x is specified because other code already ensures that in th
	--   case, only statements with a qualifier matching x are considered).
	-- * Ignore any statements after the first if it has a qualifier.
	-- The rationale is that for the diameter at [[South Pole Telescope]], wa
	-- convert to show the diameters for both the primary and secondary mirro
	-- if the convert does not specify which diameter is wanted.
	-- However, if convert is given the wanted qualifier, only one value
	-- (_the_ diameter) is wanted. For simplicity/consistency, that is also d
	-- even if no qual=x is specified. Unclear what should happen.
	-- For the wavelength at [[Nançay Radio Telescope]], want to show all thr
	-- values, and the values have no qualifiers.
