1 Usage from wikitext	2
2 Usage from Lua	2
2.1 andList	2
2.2 orList	2
2.3 forSee	2

Usage from wikitext

This module is not designed be used directly from wikitext even though `forSee` does take an initial `frame` argument and could potentially be used from wikitext, e.g.:

- `{{hatnote|PREFIX {{#invoke:Hatnote list|forSee|{{tl|For}}|Module:For|{{tl|About}}|Module:About}} POSTFIX}}` → [Vorlage:Hatnote](#)

Usage from Lua

To call the module, use

```
local mHatList = require('Module:Hatnote list')
```

or similar, then access its methods through the `mHatList` variable (or whatever was used).

andList

`andList` takes a list in table form, and returns a string with the list separated with "and" and commas as appropriate.

orList

`orList` takes a list in table form, and returns a string with the list separated with "or" and commas as appropriate.

forSee

`_forSee` takes three arguments: a table of trimmed arguments with blanks removed, a "from" number with the index to start at, and an options table, and returns a string with a number of "For X, see [[Y]]" sentences. The links are formatted using the methods from [Module:Hatnote](#).

As a convenience, the `forSee` method (without the leading underscore) takes the same arguments except with a frame instead of an args table, using `getArgs()` from [Module:Arguments](#) to preprocess the arguments.

```
--                                         Module:Hatnote list
--
-- This module produces and formats lists for use in hatnotes. In particular,
-- it implements the for-see list, i.e. lists of "For X, see Y" statements,
-- as used in {{about}}, {{redirect}}, and their variants. Also introduced
-- are andList & orList helpers for formatting lists with those conjunctions.
--

local mArguments --initialize lazily
local mFormatLink = require('Module:Format link')
local mHatnote = require('Module:Hatnote')
local libraryUtil = require('libraryUtil')
local checkType = libraryUtil.checkType
