

Modul:Namespace detect/config

This module provides configuration data for [Module:Namespace detect](#). To change the data, please follow the instructions in the module comments.

```
-----
--                               Namespace detect configuration data                               --
--                               -----
-- This module stores configuration data for Module:Namespace detect. Here --
-- you can localise the module to your wiki's language.                    --
--                               -----
-- To activate a configuration item, you need to uncomment it. This means --
-- that you need to remove the text "-- " at the start of the line.       --
--                               -----
local cfg = {} -- Don't edit this line.

-----
--                               Parameter names                               --
-- These configuration items specify custom parameter names. Values added --
-- here will work in addition to the default English parameter names.     --
-- To add one extra name, you can use this format:                         --
--                               -----
-- cfg.foo = 'parameter name'                                             --
--                               -----
-- To add multiple names, you can use this format:                       --
--                               -----
-- cfg.foo = {'parameter name 1', 'parameter name 2', 'parameter name 3'} --
--                               -----
---- This parameter displays content for the main namespace:
-- cfg.main = 'main'

---- This parameter displays in talk namespaces:
-- cfg.talk = 'talk'

---- This parameter displays content for "other" namespaces (namespaces for which
---- parameters have not been specified):
-- cfg.other = 'other'

---- This parameter makes talk pages behave as though they are the corresponding
---- subject namespace. Note that this parameter is used with [[Module:Yesno]].
---- Edit that module to change the default values of "yes", "no", etc.
-- cfg.subjectns = 'subjectns'

---- This parameter sets a demonstration namespace:
-- cfg.demospace = 'demospace'

---- This parameter sets a specific page to compare:
cfg.demopage = 'page'

-----
--                               Table configuration                               --
-- These configuration items allow customisation of the "table" function, --
-- used to generate a table of possible parameters in the module          --
-- documentation.                                                         --
--                               -----
---- The header for the namespace column in the wikipage containing the list of
```

```
---- possible subject-space parameters.
-- cfg.wikitableNamespaceHeader = 'Namespace'

---- The header for the wikitable containing the list of possible subject-space
---- parameters.
-- cfg.wikitableAliasesHeader = 'Aliases'

-----
--                               End of configuration data                               --
-----

return cfg -- Don't edit this line.
```
