Modul:Namespace detect/data

This is a data page for Module:Namespace detect and Module:Category handler/shared. It is loaded by the main module using mw.loadData, which means it is only processed once per page rather than once per #invoke.

```
--------------------------------------------------------------------------------
--                            Namespace detect data                           --
-- This module holds data for [[Module:Namespace detect]] to be loaded per    --
-- page, rather than per #invoke, for performance reasons.                    --
--------------------------------------------------------------------------------

local cfg = require('Module:Namespace detect/config')

local function addKey(t, key, defaultKey)
	if key ~= defaultKey then
		t[#t + 1] = key
	end
end

-- Get a table of parameters to query for each default parameter name.
-- This allows wikis to customise parameter names in the cfg table while
-- ensuring that default parameter names will always work. The cfg table
-- values can be added as a string, or as an array of strings.

local defaultKeys = {
	'main',
	'talk',
	'other',
	'subjectns',
	'demospace',
	'demopage'
}

local argKeys = {}
for i, defaultKey in ipairs(defaultKeys) do
	argKeys[defaultKey] = {defaultKey}
end

for defaultKey, t in pairs(argKeys) do
	local cfgValue = cfg[defaultKey]
	local cfgValueType = type(cfgValue)
	if cfgValueType == 'string' then
		addKey(t, cfgValue, defaultKey)
	elseif cfgValueType == 'table' then
		for i, key in ipairs(cfgValue) do
			addKey(t, key, defaultKey)
		end
	end
	cfg[defaultKey] = nil -- Free the cfg value as we don't need it any more.
end

local function getParamMappings()
	--[[
	-- Returns a table of how parameter names map to namespace names. The key
	-- are the actual namespace names, in lower case, and the values are the
	-- possible parameter names for that namespace, also in lower case. The
	-- table entries are structured like this:
	-- {
```

```
        --   [''] = {'main'},
        --   ['wikipedia'] = {'wikipedia', 'project', 'wp'},
        --   ...
        -- }
        --]]
        local mappings = {}
        local mainNsName = mw.site.subjectNamespaces[0].name
        mainNsName = mw.ustring.lower(mainNsName)
        mappings[mainNsName] = mw.clone(argKeys.main)
        mappings['talk'] = mw.clone(argKeys.talk)
        for nsid, ns in pairs(mw.site.subjectNamespaces) do
                if nsid ~= 0 then -- Exclude main namespace.
                        local nsname = mw.ustring.lower(ns.name)
                        local canonicalName = mw.ustring.lower(ns.canonicalName)
                        mappings[nsname] = {nsname}
                        if canonicalName ~= nsname then
                                table.insert(mappings[nsname], canonicalName)
                        end
                        for _, alias in ipairs(ns.aliases) do
                                table.insert(mappings[nsname], mw.ustring.lower(a
                        end
                end
        end
        return mappings
end

return {
        argKeys = argKeys,
        cfg = cfg,
        mappings = getParamMappings()
}
```

Modul:Category handler/shared

Usage

{{#invoke:Category handler|*function_name*}}

```
-- This module contains shared functions used by [[Module:Category handler]]
-- and its submodules.

local p = {}

function p.matchesBlacklist(page, blacklist)
	for i, pattern in ipairs(blacklist) do
		local match = mw.ustring.match(page, pattern)
		if match then
			return true
		end
	end
	return false
end

function p.getParamMappings(useLoadData)
	local dataPage = 'Module:Namespace detect/data'
	if useLoadData then
		return mw.loadData(dataPage).mappings
	else
		return require(dataPage).mappings
	end
end

function p.getNamespaceParameters(titleObj, mappings)
	-- We don't use title.nsText for the namespace name because it adds
	-- underscores.
	local mappingsKey
	if titleObj.isTalkPage then
		mappingsKey = 'talk'
	else
		mappingsKey = mw.site.namespaces[titleObj.namespace].name
	end
	mappingsKey = mw.ustring.lower(mappingsKey)
	return mappings[mappingsKey] or {}
end

return p
```

Modul:Namespace detect

This module allows you to output different text depending on the namespace that a given page is in. It is a Lua implementation of the Vorlage:Tl template, with a few improvements: all namespaces and all namespace aliases are supported, and namespace names are detected automatically for the local wiki.

Inhaltsverzeichnis

Usage

```
{{#invoke: Namespace detect | main
| page              = <!-- page to detect namespace for, if not the current page
| main              = <!-- text to return for the main namespace -->
| talk              = <!-- text to return for talk namespaces -->

<!-- text to return for specific subject namespaces -->
| portal            =
| category          =
| user                    =
| wikipedia         =
| mediawiki         =
| book              =
| timedtext         =
| template          =
| special           =
| media             =
| file              =
| image             =
| help                    =
| module            =

| other             = <!-- text to return for unspecified namespaces -->
| demospace         = <!-- namespace to display text for -->

| subjectns         = <!-- set to "yes" to treat talk pages as the corresponding
}}
```

Parameters

- **main** - text to return if the page is in the main namespace.
- **talk** - text to return if the page is in a talk namespace. This can be any talk namespace - it will match any of "Talk:", "Wikipedia talk:", "User talk:", etc.

- Subject namespace parameters, e.g. **wikipedia**, **user**, **file**... - the text to return if the page is in the corresponding namespace. This module accepts all subject namespaces as parameters, including namespace aliases and virtual namespaces. See below for a list of supported values.
- **other** - text to return if no parameters for the page's namespace were specified. This text is also returned if Vorlage:Para is set to an invalid namespace value.
- **subjectns** - if on a talk page, use the corresponding subject page. Can be set with values of "yes", "y", "true" or "1".
- **demopage** - specifies a page to detect the namespace of. If not specified, and if the Vorlage:Para parameter is not set, then the module uses the current page.
- **demospace** - force the module to behave as if the page was in the specified namespace. Often used for demonstrations.

Namespace parameters

Possible values for subject namespace parameters are as follows:

Namespace	Aliases
main	
benutzer	user, benutzerin
projekt	project
datei	file, bild, image
mediawiki	
vorlage	template
hilfe	help
kategorie	category
attribut	property
formular	form
konzept	concept
smw/schema	smw/schema
rule	
widget	
campaign	
timedtext	
modul	module
blog	
socialentity	
gadget	
gadget-definition	gadget definition
copikiblog	

Namespace	Aliases
deutsch	
english	
français	
italiano	
español	
nederlands	
slovenská	
dansk	
polska	
suomi	

Table function

Use the following to display a table with the different possible namespace parameters:

```
{{#invoke:Namespace detect|table|talk=yes}}
```

To include the parameter for talk namespaces, use Vorlage:Para.

Porting to different wikis

This module is designed to be portable. To use it on a different wiki, all you need to do is to change the values in Module:Namespace detect/config. Instructions are available on that page.

Technical details

The module uses a data page at Module:Namespace detect/data. This page is loaded with mw.loadData, which means it is processed once per page rather than once per #invoke. This was done for performance reasons.
