Modul:Protection banner/Doku

Dies ist die Dokumentationsseite für Modul:Protection banner

Vorlage:Lua This module creates protection banners and padlock icons that are placed at the top of protected pages.

5 Technical details 4

Usage

Most users will not need to use this module directly. For adding protection templates to pages you can use the Vorlage:Tl template, or you may find it more convenient to use one of the more specific protection templates in the table below.

Vorlage:Protection templates

From wikitext

```
{{#invoke:Protection banner|main
| 1        = reason
| small    = yes/no
| action   = action
| date     = protection date
| user     = username
| section  = talk page section name
| category = no
}}
```

The #invoke syntax can be used for creating protection templates more specific than Vorlage:Tl. For example, it is possible to create a protection template which always shows a padlock icon by using the code `{{#invoke:Protection banner|main|small=yes}}`. Pages which call this template will still be able to use other arguments, like *action*. However, this only works one level deep; a page calling a template which calls another template containing the above code will not automatically be able to use parameters like *action*.

Note: *You should no longer specify the expiry, as it is automatically retrieved in all cases.*

From Lua

First, load the module.

```
local mProtectionBanner = require('Module:Protection banner')
```

Then you can make protection banners by using the _main function.

```
mProtectionBanner._main(args, cfg, titleObj)
```

args is a table of arguments to pass to the module. For possible keys and values for this table, see the parameters section. The *cfg* and *titleObj* variables are intended only for testing; *cfg* specifies a customised config table to use instead of Module:Protection banner/config, and *titleObj* specifies a mw.title object to use instead of the current title. *args*, *cfg* and *titleObj* are all optional.

Parameters

All parameters are optional.

- **1** – the reason that the page was protected. If set, this must be one of the values listed in the reasons table.
- **small** – if set to "yes", "y", "1", or "true", a padlock icon is generated instead of a full protection banner.
- **action** – the protection action. Must be one of "edit" (for normal protection), "move" (for move-protection) or "autoreview" (for pending changes). The default value is "edit".
- **date** – the protection date. This must be valid input to the second parameter of the #time parser function. This argument has an effect for reasons that use the PROTECTIONDATE parameter in their configuration. As of July 2014, those were the "office" and "reset" reasons.
- **user** – the username of the user to generate links for. As of July 2014, this only has an effect when the "usertalk" reason is specified.
- **section** – the section name of the protected page's talk page where discussion is taking place. This works for most, but not all, values of *reason*.
- **category** – categories are suppressed if this is set to "no", "n", "0", or "false".
- **catonly** – if set to "yes", "y", "1", or "true", will only return the protection categories, and not return the banner or padlock. This has no visible output.

Reasons

The following table contains the available reasons, plus the actions for which they are available.

Skriptfehler: Ein solches Modul „Protection banner/documentation“ ist nicht vorhanden.

Errors

Below is a list of some of the common errors that this module can produce, and how to fix them.

Invalid protection date

Vorlage:Error

This error is produced if you supply a Vorlage:Para parameter value that is not recognised as a valid date by the #time parser function. If in doubt, you can just use a date in the format "dd Month YYYY", e.g. "17 November 2026". To see a full range of valid inputs, see the #time documentation (only the first parameter, the *format string*, may be specified).

Invalid action

Vorlage:Error

This error is produced if you specify an invalid protection action. There are only three valid actions: `edit` (the default, for normal protection), `move` (for move-protection), and `autoreview` (for pending changes). This should only be possible if you are using a template that supports manually specifying the protection action, such as Vorlage:Tl, or if you are using #invoke directly. If this is not the case, please leave a message on Module talk:Protection banner.

Reasons cannot contain the pipe character

Vorlage:Error

This error is produced if you specify a reason using the Vorlage:Para parameter that includes a pipe character ("|"). Please check that you are not entering the Vorlage:Tl template into this parameter by mistake. The pipe character is disallowed as the module uses it internally. A list of valid reasons can be seen in the reasons section.

Other errors

If you see an error other than the ones above, it is likely to either be a bug in the module or mistake in the configuration. Please post a message about it at Module talk:Protection banner.

Technical details

This module uses configuration data from Module:Protection banner/config. Most of the module's behaviour can be configured there, making it easily portable across different wikis and different languages.

General test cases for the module can be found at Module:Protection banner/testcases, and test cases specific to enwiki's config can be found at Module:Protection banner/config/testcases.

Bug reports and feature requests should be made on the module's talk page.

--[[
-- Banner data consists of six fields:
-- * text - the main protection text that appears at the top of protection
--   banners.
-- * explanation - the text that appears below the main protection text, used
--   to explain the details of the protection.
-- * tooltip - the tooltip text you see when you move the mouse over a small
--   padlock icon.
-- * link - the page that the small padlock icon links to.
-- * alt - the alt text for the small padlock icon. This is also used as tooltip
--   text for the large protection banners.
-- * image - the padlock image used in both protection banners and small padlock
--   icons.
--
-- The module checks in three separate tables to find a value for each field.
-- First it checks the banners table, which has values specific to the reason
-- for the page being protected. Then the module checks the defaultBanners
-- table, which has values specific to each protection level. Finally, the
-- module checks the masterBanner table, which holds data for protection
-- templates to use if no data has been found in the previous two tables.
--
-- The values in the banner data can take parameters. These are specified
-- using ${TEXTLIKETHIS} (a dollar sign preceding a parameter name
-- enclosed in curly braces).
--
--                            Available parameters:
--
-- ${CURRENTVERSION} - a link to the page history or the move log, with the
-- display message "current-version-edit-display" or
-- "current-version-move-display".
--
-- ${EDITREQUEST} - a link to create an edit request for the current page.
--
-- ${EXPLANATIONBLURB} - an explanation blurb, e.g. "Please discuss any changes
-- on the talk page; you may submit a request to ask an administrator to make
-- an edit if it is minor or supported by consensus."
--
-- ${IMAGELINK} - a link to set the image to, depending on the protection
-- action and protection level.
--
```

```
-- ${INTROBLURB} - the PROTECTIONBLURB parameter, plus the expiry if an expiry
-- is set. E.g. "Editing of this page by new or unregistered users is currently
-- disabled until dd Month YYYY."
--
-- ${INTROFRAGMENT} - the same as ${INTROBLURB}, but without final punctuation
-- so that it can be used in run-on sentences.
--
-- ${PAGETYPE} - the type of the page, e.g. "article" or "template".
-- Defined in the cfg.pagetypes table.
--
-- ${PROTECTIONBLURB} - a blurb explaining the protection level of the page, e.g
-- "Editing of this page by new or unregistered users is currently disabled"
--
-- ${PROTECTIONDATE} - the protection date, if it has been supplied to the
-- template.
--
-- ${PROTECTIONLEVEL} - the protection level, e.g. "fully protected" or
-- "semi-protected".
--
-- ${PROTECTIONLOG} - a link to the protection log or the pending changes log,
-- depending on the protection action.
--
-- ${TALKPAGE} - a link to the talk page. If a section is specified, links
-- straight to that talk page section.
--
-- ${TOOLTIPBLURB} - uses the PAGETYPE, PROTECTIONTYPE and EXPIRY parameters to
-- create a blurb like "This template is semi-protected", or "This article is
-- move-protected until DD Month YYYY".
--
-- ${VANDAL} - links for the specified username (or the root page name)
-- using Module:Vandal-m.
--
--                                  Functions
--
-- For advanced users, it is possible to use Lua functions instead of strings
-- in the banner config tables. Using functions gives flexibility that is not
-- possible just by using parameters. Functions take two arguments, the
-- protection object and the template arguments, and they must output a string.
--
-- For example:
--
-- text = function (protectionObj, args)
--     if protectionObj.level == 'autoconfirmed' then
--         return 'foo'
--     else
--         return 'bar'
--     end
-- end
--
-- Some protection object properties and methods that may be useful:
-- protectionObj.action - the protection action
-- protectionObj.level - the protection level
-- protectionObj.reason - the protection reason
-- protectionObj.expiry - the expiry. Nil if unset, the string "indef" if set
--     to indefinite, and the protection time in unix time if temporary.
-- protectionObj.protectionDate - the protection date in unix time, or nil if
--     unspecified.
-- protectionObj.bannerConfig - the banner config found by the module. Beware
--     of editing the config field used by the function, as it could create an
--     infinite loop.
-- protectionObj:isProtected - returns a boolean showing whether the page is
--     protected.
-- protectionObj:isTemporary - returns a boolean showing whether the expiry is
--     temporary.
```

```
-- protectionObj:isIncorrect - returns a boolean showing whether the protection
--     template is incorrect.

```
--------------------------------------------------------------------------------
-- Padlock indicator names
--------------------------------------------------------------------------------

-- This table provides the "name" attribute for the <indicator> extension tag
-- with which small padlock icons are generated. All indicator tags on a page
-- are displayed in alphabetical order based on this attribute, and with
-- indicator tags with duplicate names, the last tag on the page wins.
-- The attribute is chosen based on the protection action; table keys must be a
-- protection action name or the string "default".
padlockIndicatorNames = {
        autoreview = 'pp-autoreview',
        default = 'pp-default'
},

--------------------------------------------------------------------------------
-- Protection categories
--------------------------------------------------------------------------------

--[[
-- The protection categories are stored in the protectionCategories table.
-- Keys to this table are made up of the following strings:
--
-- 1. the expiry date
-- 2. the namespace
-- 3. the protection reason (e.g. "dispute" or "vandalism")
-- 4. the protection level (e.g. "sysop" or "autoconfirmed")
-- 5. the action (e.g. "edit" or "move")
--
-- When the module looks up a category in the table, first it will will check to
-- see a key exists that corresponds to all five parameters. For example, a
-- user page semi-protected from vandalism for two weeks would have the key
-- "temp-user-vandalism-autoconfirmed-edit". If no match is found, the module
-- changes the first part of the key to "all" and checks the table again. It
-- keeps checking increasingly generic key combinations until it finds the
-- field, or until it reaches the key "all-all-all-all-all".
--
-- The module uses a binary matrix to determine the order in which to search.
-- This is best demonstrated by a table. In this table, the "0" values
-- represent "all", and the "1" values represent the original data (e.g.
-- "indef" or "file" or "vandalism").
--
--        expiry    namespace reason   level     action
-- order
-- 1      1         1         1        1         1
-- 2      0         1         1        1         1
-- 3      1         0         1        1         1
-- 4      0         0         1        1         1
-- 5      1         1         0        1         1
