1.2 From Lua .....	2
2 Technical details .....	2

## Usage

---

### From wikitext

---

From wikitext, this module should be called from a template, usually Vorlage:TI. Please see the template page for documentation. However, it can also be called using the syntax `{{#invoke:shortcut|main|arguments}}`.

### From Lua

---

To use this module from Lua, first load it.

```
local mShortcut = require('Module:Shortcut')
```

Then you can create shortcut boxes with the following syntax:

```
mShortcut._main(shortcuts, options, frame, cfg)
```

- *shortcuts* is an array of shortcut page names. (required)
- *options* is a table of options. The following keys are supported:
  - *msg* - a message to leave after the list of shortcuts.
  - *category* - if set to false (or a value regarded as false by Module:Yesno, such as "no"), categories are suppressed.
- *frame* a frame object. This is optional, and only intended to be used internally.
- *cfg* a table of config values. This is optional, and is only intended for testing.

## Technical details

---

This module has a configuration file at Module:Shortcut/config. It can be used to translate this module into different languages or to change details like category names.
